

## Meeting the Challenges of Diabetes: Consequences of Disease Progression

The MCO Diabetes Performance Improvement Collaborative  
May 11, 2022

Tammy Chambers  
Janet Unga, CNP

1

## MN Health Plans Collaborative

2

## Introductions

**Janet Unga, Nurse Practitioner, Endocrinology**

- Graduated from University of Iowa, BSN and of Missouri for MSN as a clinical nurse specialist with an emphasis in Diabetes.
- Twenty years after that degree, went back to Graceland University online and completed a Family Nurse Practitioner program with an emphasis in diabetes care and management.
- I have held a certification in diabetes education for over 20 years and have worked with diabetes patients for about 25 years total, the last 12 years as a NP.
- I have been practicing at Park Nicollet since October 2016 and was in Cedar Rapids Iowa before that.

3

3

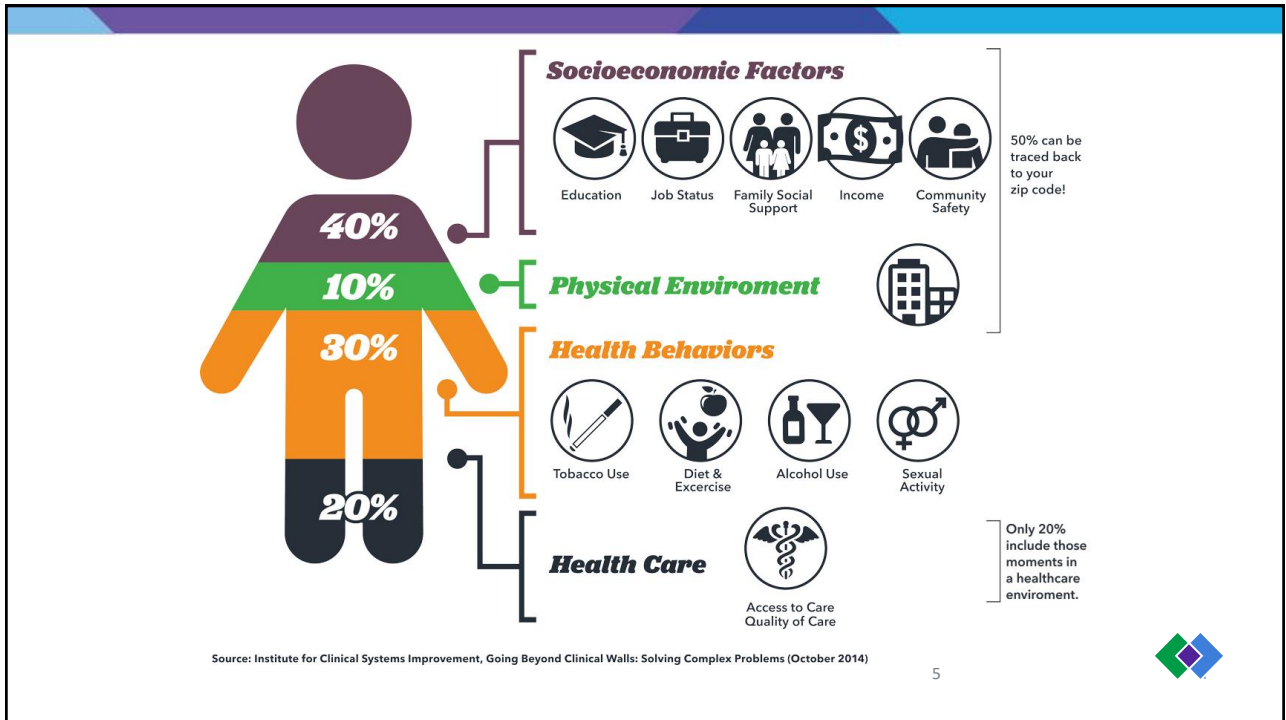

## Objectives

- Discuss incidence and cost of diabetes
- Discuss microvascular complications-eye, kidney, feet
- 2022 ADA treatment guidelines
- How to engage patient as partner

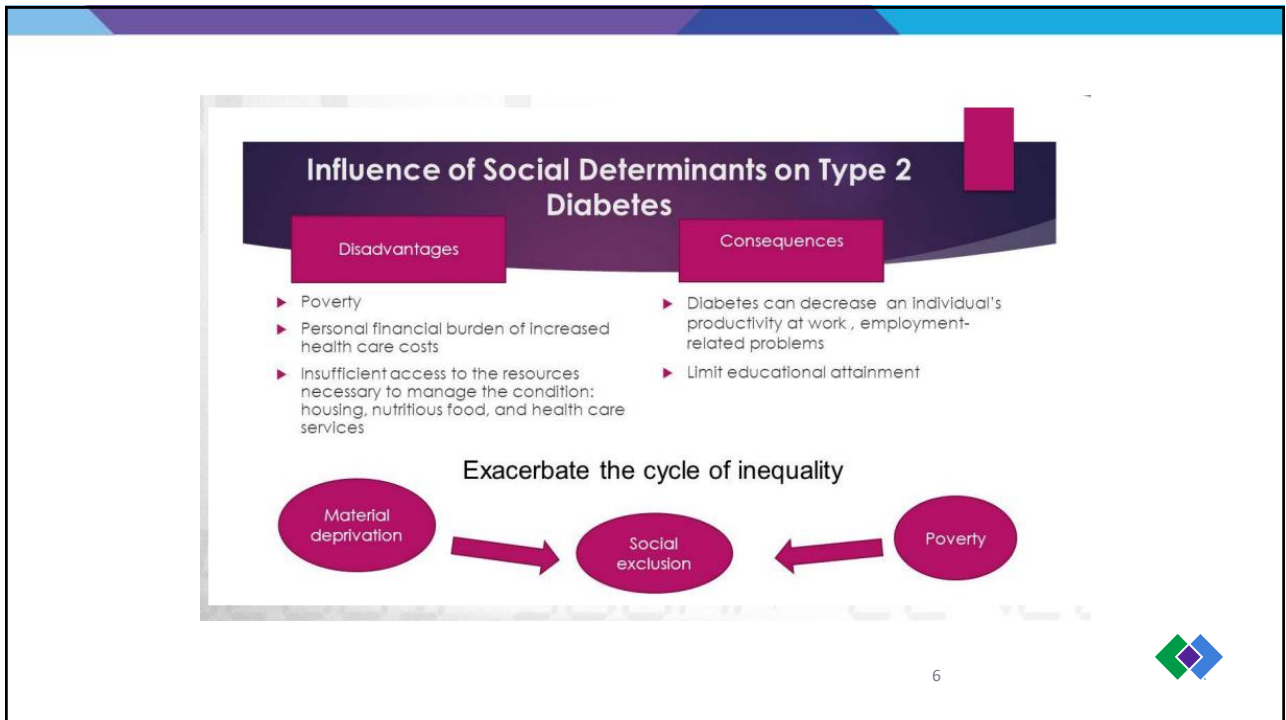

4

4

5

6

## Diabetic Retinopathy Incidence In Low Income/ Education /Medicaid -Like population

	n	Retinopathy (n)	Prevalence of retinopathy (%)	Model 1		Model 2		Model 3	
				OR	95% CI	OR	95% CI	OR	95% CI
<b>Education level</b>									
College	235	45	19.2	1.00		1.00		1.00	
High school	316	76	24.1	1.28	(0.84-1.95)	1.31	(0.86-2.04)	1.29	(0.49-1.22)
Junior high school	102	31	30.4	1.85	(1.07-3.17)	1.91	(1.09-3.34)	1.38	(0.75-2.49)
<b>Income level</b>									
High	207	41	19.8	1.00		1.00		1.00	
Middle	201	48	23.9	1.36	(0.84-2.19)	1.44	(0.88-2.36)	1.15	(0.68-1.94)
Low	175	47	26.9	1.66	(1.02-2.72)	1.56	(0.94-2.6)	1.12	(0.65-1.94)
<b>Public healthcare insurance</b>									
Others	608	132	21.7	1.00		1.00		1.00	
Public assistance	64	24	37.5	2.27	(1.29-3.92)	2.19	(1.20-3.95)	1.72	(0.91-3.21)
<b>Employment status</b>									
Regular employment	313	58	18.5	1.00		1.00		1.00	
Irregular employment	158	42	26.6	1.80	(1.13-2.85)	1.72	(1.03-2.86)	1.40	(0.82-2.39)
No employment	179	52	29.1	2.00	(1.30-3.09)	2.23	(1.36-3.68)	1.71	(1.01-2.90)

OR, odds ratio; 95% CI, 95% confidence interval; SES, socioeconomic status; BMI, body mass index  
 Model 1: Adjusted for age  
 Model 2: Model 1 + gender, marital status, BMI, physical activity, smoking, and drinking  
 Model 3: Model 2 + duration of diabetes and HbA1c

Socioeconomic status and type 2 diabetes complications among young adult patients in Japan  
 Mitsuhiro Funakoshi, Yasushi Azami, Jiro Miura

doi: 10.1161/JAHA.117.007425.

## Race and Socioeconomic Status Independently Affect Risk of Major Amputation in Peripheral Artery Disease

Shipra Arya<sup>1,2</sup>, Zachary Binney<sup>3</sup>, Anjali Khakharia<sup>4</sup>, Luke P Brewster<sup>4,5</sup>, Phil Goodney<sup>6</sup>, Rachel Patzer<sup>7,8</sup>, Jason Hockenberry<sup>8</sup>, Peter W F Wilson<sup>9,10</sup>

8

8

# Incidence and cost

- ADA 2019 stats
- 1 in 10 people have diabetes
- ~37.3 million Americans
- 1.9 million type 1
  
- Cost-26% increase from 2012 to 2017
  - Most recent data \$327 billion/year
  - 1 in 4 health care dollars
  - Over age 65 highest costs-hello baby boomers

9

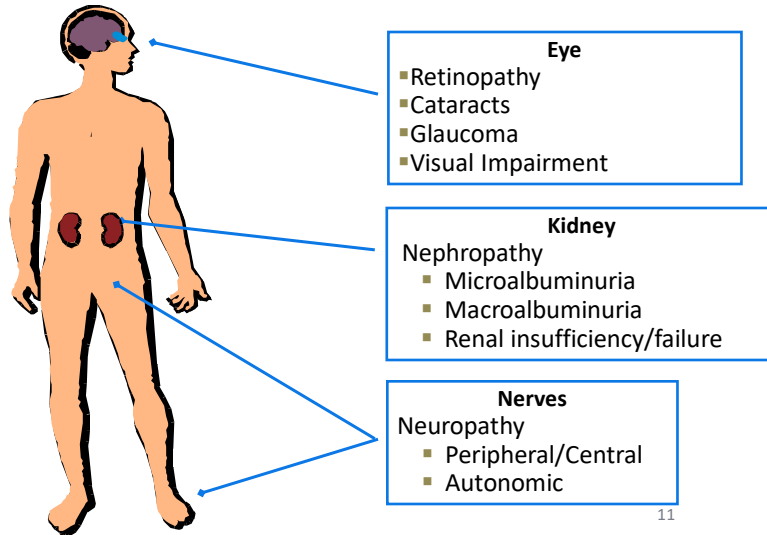

9

## Microvascular Complications Associated with Diabetes

10

## Microvascular Complications of Diabetes: From Head to Toe

11

## Microvascular-how does it happen

- Major contributors: BG, BP, LDL
  - Harden and stiffen vessels causing bleeding
  - Irritation of nerves
  - Smallest vessels in eye and kidney

12

12

# Eye-Retinopathy

- Severity depends on length and degree of diabetes control
- Likely to have kidney issues as well

13

13

## Scope of Retinopathy in Diabetes(DR)

- After 20 years of diabetes- Evidence of retinopathy in almost all patients with type 1 DM, 60-85% with type 2 DM
- Leading cause of new cases of blindness among adults aged 20-74 years
- Detecting and treating diabetic eye disease with laser can reduce the development of severe vision loss by 50-60%

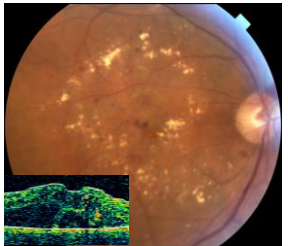

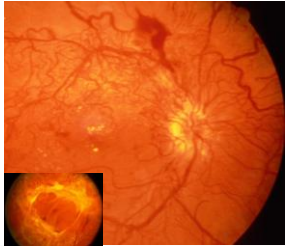

National Diabetes Fact Sheet, US 2011  
Bressler *et al.* NEJM 2011; 365: 1520-1526

14

14

## Classification of Retinopathy in diabetes

		
<p><b>Microvascular damage</b></p> <ul style="list-style-type: none"> <li>• Chronic, occurring over years</li> <li>• Typically no significant vision loss, but progresses to DME and/or PDR</li> <li>• Similar damage occurs in other end-organ vascular beds</li> </ul>	<p><b>Swelling in central retina</b></p> <ul style="list-style-type: none"> <li>• <b>Accounts for most vision loss</b></li> <li>• Clinically significant ME (CSME) involves or threatens the fovea</li> <li>• Co-exists with any level of DR</li> </ul>	<p><b>End stage</b></p> <ul style="list-style-type: none"> <li>• Neovascularization of retina</li> <li>• High risk of severe visual loss</li> </ul>
<p>More common  Less common</p> <p style="margin-left: 50px;">Less severe <span style="margin-left: 150px;">More severe</span></p>		<p>15</p>

15

## What does diabetic retinopathy look like?

16

16

## ADA recommendations

Diabetes Type	Recommended Time For First Examination	Recommended Follow-up
Type 1	At time of diagnosis	Every 5 years
Type 2	At time of diagnosis	Yearly

American Academy of Ophthalmology Retina Panel. Preferred Practice Pattern® Guidelines.

- 40-50% do not receive recommended eye care (NCQA, 2009)
- Joslin study of patient self-awareness of DR (ARVO, 2011; n=3100)
  - 93% of patients with DR and 63% with vision-threatening DR were unaware they had *any* DR
  - 83% with vision-threatening DR had no scheduled follow-up eye exam

ARVO = The Association for Research in Vision and Ophthalmology; NCQA = National Committee for Quality Assurance.

17

17

## Retinopathy: What We Know & What We Are Learning

### We Know – The following are critical:

- Regular eye check ups
- Glucose control
- Blood pressure control
- Smoking cessation
- Women planning or pregnant should have prompt eye exam with follow-up

### We Are Learning:

- ACE/ARB's may slow progression of retinopathy
- Fenofibrate may slow progression of retinopathy (30-40%) - FIELD and ACCORD-EYE
- VEGF inhibitors with prompt or deferred laser gold-standard Rx for diabetic macular edema (DME)

18

18

# Kidney-Nephropathy

- How does it happen?
- BP, BG and LDL contributes to vessel disease-  
filtration unit

19

19

## Glomerular Filtration Rate (GFR)

- Glomerular Filtration Rate (GFR) is most useful to determine level of kidney impairment
  - GFR does not help determine cause of kidney disease
  - GFR is rough measure of the number of filtering nephrons
  - Cannot be measured directly
  - Not recommended for
    - Extremes of age (children and elderly)
    - Malnutrition
    - Severe obesity
    - Altered muscle mass (amputee)

20

# Kidney Failure in U.S.

Source: United States Renal Data System. *USRDS 2012 Annual Data Report*

21

21

# Stages of Chronic Kidney Disease (CKD)

Stage	eGFR (ml/min/1.73 m <sup>2</sup> )	Description	Action
<b>1</b>	>90	Normal or higher GFR w. evidence of kidney dx	Dx and Rx of co-morbidities
<b>2</b>	60-89	Mild decrease in GFR	Monitor progress and Rx co-morbidities
<b>3</b>	30-59	Moderate decrease in GFR	Monitor progress and Rx co-morbidities and consider referral
<b>3a</b>	45-59		
<b>3b</b>	30-44		
<b>4</b>	15-29	Severe decrease in GFR	Pre ESKD, prepare pt. for dialysis
<b>5</b>	<15	Kidney failure	Dialysis or replacement

CKD defined as Stage 3 or higher for 3 months or more

*Am J Kid Dis* 2002 39:51-266

Bakris, GL. *Mayo Clin Proc* 2011 86:444-456

22

22

## Nephropathy Screening Recommendations

### Nephropathy

- Urinary albumin and eGFR screen at least 1x/year (Albumin/creatinine (A/C) ratio preferred)

### Type 1 Diabetes

- After 5 years duration (age >10 or puberty, whichever is earlier); annually thereafter

### Type 2 Diabetes or any diabetes with hypertension

- At diagnosis; annually thereafter

## Albuminuria: Definitions

Term	ACR (albumin:creatinine ratio) (aka UMAR)	
Nephrotic Range Proteinuria	> 3,500 mg/g	
Macroalbuminuria ("Very High Albuminuria")	> 300 mg	Increased ESRD risk
Microalbuminuria ("High Albuminuria")	30-300 mg/g	Increased CV Risk
"Normal"	0-30 mg/g	

- Confirm with two or more samples over 3-6 months

## Treatment of Nephropathy in diabetes

- Glucose control
  - A1C <7% delays onset of albuminuria- individualize target for pt safety
- Smoking cessation
- ASA/Lipids
  - All patients with persistent albuminuria should be Rx with ASA and statins
  - Consider ASA and statins in all patients with eGFR <60 ml/min
  - Fenofibrate may further reduce albuminuria (ACCORD-LIPID) but can increase serum creatinine
- Low protein diet (0.8 g/kg/day)
- ACEi/ARB not indicated for primary prevention in those with normal blood pressure, A:C ratio <30, and normal GFR

25

25

## Treatment of Nephropathy in diabetes

### Blood pressure control:

- <140/90 mmHg
- Can consider lower target e.g. <130/80 mmHg if significant proteinuria
- Start ACE Inhibitor(ACE-I) or Angiotensin II Receptor Blocker (ARB)
  - Baseline creatinine and K+, repeat in 1-2 weeks
  - Titrate dose to maximum approved hypertension dose if can be achieved safely
  - Monitor A/C ratio to assess response to therapy and progression of disease
  - Similar BP control and kidney protection actions
- May need multiple BP medications to reach goal
  - UKPDS 30% pts with 3 or more drugs

26

26

# Feet-Neuropathy

- How does it happen
- BG affects protective coating on nerves-telephone wire
- Delay of signal
- Loss of protection-can't feel pain
- Pt. has loss of flexibility and eyesight acuity to self evaluate

27

27

## Signs and Symptoms of Diabetic Peripheral Neuropathy

### Symptoms

- Numbness or loss of sensation (asleep or “bunched up sock under toes” sensation)
- Prickling/Tingling
- Pain (aching, burning, lancinating)
- Unusual sensitivity or tenderness when feet are touched (allodynia)

### Signs

- Diminished vibratory perception
- Decreased knee and ankle reflexes
- Reduced protective sensation such as pressure, hot and cold, pain
- Diminished ability to sense position of toes and feet

### **Peripheral and Symmetric Stocking Glove Distribution**

Symptoms and signs progress from distal to proximal over time

28

## The Foot Examination

### *Standards of Care at Diagnosis and Annually*

Visual Exam: careful inspection

- Skin, shoes, shape of foot

Vascular integrity

- Pulses
- Capillary refill
- Ankle-Brachial Pressure Index (if indicated)

Neurological examination and function

- Light touch (5.07/ 10g monofilament)
- Vibratory sensation (128-Hz tuning fork)
- Reflexes

Source: Staged Diabetes Management, 5th edition, Quick Guide, pages 7-26.

29

## ADA 2022 guidelines

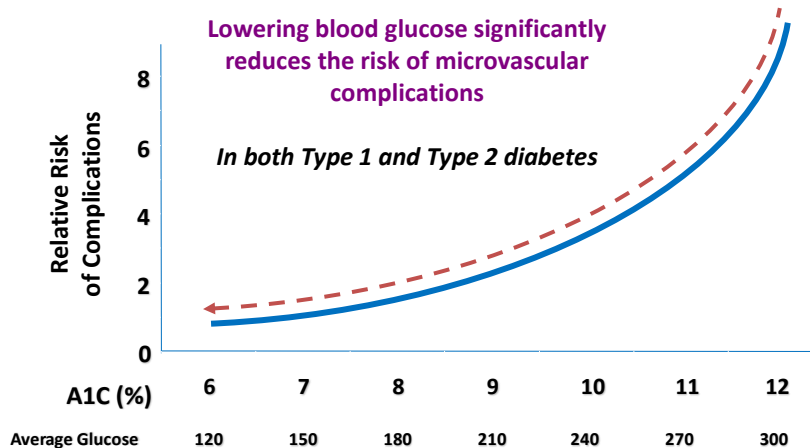

- Screen at age 35-A1c, BG levels
- Diabetes diagnosis based on A1c and fasting or random BG
- A1c goals based on DCCT 6.5%
  - Elderly goals for A1c
  - Daily BG levels part of evaluation of control
  - Smaller BG range is goal, 70% between 70-180 24 hour levels

31

31

## Intensive Diabetes Therapy: Reduced Incidence of Complications

	DCCT	Kumamoto	UKPDS
HbA1c	9 → 7.2%	9 → 7%	8 → 7%
Retinopathy	63%	69%	17% to 21%
Nephropathy	54%	70%	24% to 33%
Neuropathy	60%	Improved	-
Cardiovascular Dx	41%	-	16%

32

32

## Priorities of Care for Adults with Diabetes

33

## ENGAGE your patient to partner with you

- Goal to keep them out of hospital or ED
- Establish rapport/trust
- Frequent contact with you
- Listen, non judgmental, no scolding
- Moderate your expectations-goal to move them forward
- Thank them for making the effort to come see you
- Recognize their efforts

34

34

## Cases-#1 difficult to motivate

- Case #1-30 something male, type 1
- Heavy smoker, ADD, oppositional, defiant, autistic
- First visit: argumentative, poor control, had many previous providers.
- Poor historian

35

35

## Case 1 cont

- My approach
  - Listened-see where he was
  - Establish rapport
  - Get him to come back
  - Avoid hospital-refusal to go
  - Communication with his case worker

36

36

## Case 1 result

- Ongoing problems but he comes and I can talk to him, reason with him
- Measurable changes?
- His confidence is improved, more calm

37

37

## Case #2 Foot issues and challenges

- Male 40's type 1 with "foot sore" for a year
- My first visit with him
  - Low income
  - Afraid to lose his job
- Multiple ulcers, non painful
- Refused urgent or emergent care
- Podiatry after a week with follow up wound care and treatment

38

38

## Case # 3 food insecurity

- Pregnant type 1
- Mental health issues
- Drinking 4 or more regular Mt Dew daily
- Not hungry for other food
- Went for “low hanging fruit”
- Goal to decrease amount of pop

39

39

## SUMMARY

- Encourage regular provider visits-3-6 months
- Encourage annual eye and foot exam with labs
- Goal to keep them out of the hospital/ED
- Establish rapport/trust
- Frequent visits
- LISTEN
- Making any progress is good
- Realize your limits

40

40

# Questions?

41

## Thank You!
